

Children and young people's health technology project

More children, young people and families now rely on health technology to manage their long-term health conditions. Health technology includes things like mobile applications (apps), devices, interactive websites.

Our team previously explored concerns children and young people have about using health technology. We found that young people had some concerns such as privacy, how they access technology, and whether the technology was reliable.

We are now wanting to find out what aspects of technology mean a young person is more likely to want to use it for their health.

We also want to find out the best ways to develop health technology for use by young people.

It is important that we work with young people with health conditions, and their parents or carers on this project. We are currently setting up a group of young people and parents to tell us what is important to consider when developing health technology for young people.
